

# The Walker Grinder

The Walker Grinder is a food waste and organics management system that allows users to grind food waste on site. We regularly collect the resulting slurry and process it into a biogas – turning your food waste into renewable energy.

**Ideal for food retailers, food processors, commercial kitchens, and mid to large cafeteria operations.**

The Walker Grinder drastically reduces the volume of food waste at your facility. This means more time between pickups and a reduced carbon footprint from collection and transportation.

## Why the Walker Grinder?

- Compact, space-saving stainless steel design
- Self-contained storage of food waste eliminates odours, pests and rodents
- Reduced volume of food waste
- Simple one-button operation with remote monitoring and auto-scheduled collection
- Dedicated and ongoing support including training and reporting

Building a sustainable future, **together.**

# Turning Food Waste to Energy

## Grinding

Easily grind organic waste on site. Slurry is stored in a tightly-sealed storage tank to await collection.

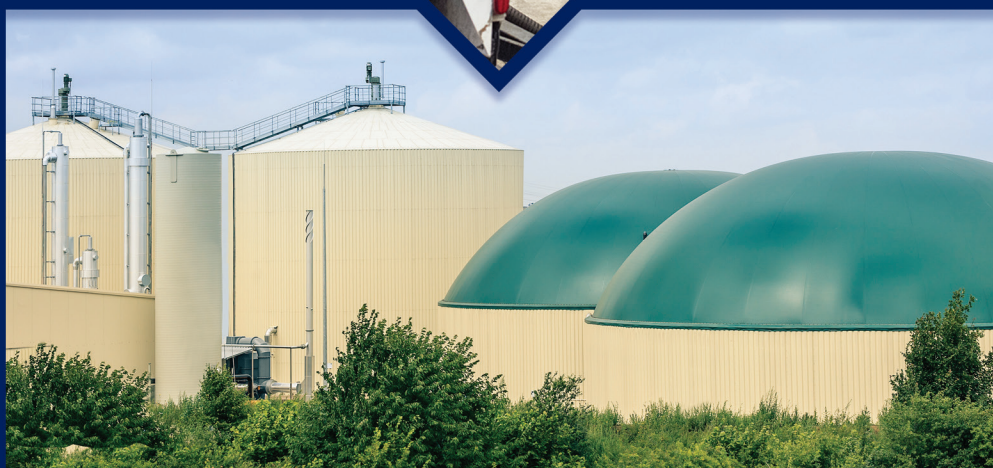

## Slurry Collection

A Walker vacuum truck collects the slurry, using remote monitoring to determine the ideal pick-up time.

## Processing

Slurry is transported to an anaerobic digestion facility for processing.

## Biogas Power Generation

Through the anaerobic digestion process, your food waste is used to generate renewable, clean energy, contributing to a sustainable future.
